                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The human mitochondrial adenylate kinase (HMAK) (854bp) gene encodes a protein of 227 amino acids ) can be administered therapeutically. Cespecially by expressing encoding polypeptides, to treat neurological disorders e.g. Alzheimer's disease, Huntington's disease, epilepsy. It can be combined with a suitable carrier in pharmaceutical compositions, which can be administered to treat such disorders. HMAK was shown to have chemical and structural homology with adenylate kinase isozyme 3 (AK3) from cow, rat and human (92, 91 and 57 % identity respectively) and was expressed in e.g. cancerous tissues, brain and neural tissues and tissues involved in inflammation and the immune response. Increased activity or expression was proposed to be associated with cancer and immunological disorders, and decreased activity/expression with the development of neurological disorders. Products of the above invention may be used in the diagnosis and treatment of the above

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       720
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          88
```

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the computementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprises a 3'-end sequence, where the polynucleotide which comprises a 3'-end sequence, where the

a combination

The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 1701 BP; 500 A; 348
                                                                                                                                                                                                                                      542
                                                                                                                                                                600

CC This sequence represents a nucleic acid molecule designated Gene 58 from CC the human cDNA clone HHFHN61 (deposited as clone ATCC 97899 and ATCC 209045) which encodes a secreted human protein. The gene can be used to CC generate fusion proteins by linking to the gene to a human cC immunoglobulin Fc portion (e.g. AAV59502) for increasing the stability of CC the fused protein as compared to the human protein only.

CC The invention relates to 186 novel genes and their fragments (nucleic cC acid sequences: AAV59511-V59812; amino acid sequences AAW74731-W75026) CC which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions CC can be diagnosed by determining the amount of the new polypeptides in a CC sample or by determining the amount of the new polypeptides. Specific uses are described for each of the 186 CC polynucleotides, based on which tissues they are most highly expressed in CC (see AAV59511 for described uses).

to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end complementary to a polynucleotide comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence complementary to a coligonucleotide comprises a 1'-end sequence, where the coligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length CDNAs easily without any specialised methods. AAH03166 to AAH13628 and CC AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to

                                                                                                            Q
                                                                                                                                        Дb
                                                                                                                                                               Q
                                                                                                                                                                                                                                                       CC AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon CC cancer-associated nucleic acid molecules (N) and proteins (P), where CC the proteins are collectively known as colon cancer antigens. The colon CC cancer antigens have cytostatic activity and can be used in gene CC therapy and vaccine production. N and P may be used in the prevention, CC diagnosis and treatment of diseases associated with inappropriate P CC expression. For example, N and P may be used to treat disorders CC associated with decreased expression by rectifying mutations or deletions CC in a patient's genome that affect the activity of P by expressing CC inactive proteins or to supplement the patients own production of P. CC Additionally, N may be used to produce the colon cancer-associated Ps, CC by inserting the nucleic acids into a host cell and culturing the cell CC by inserting the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 CC and AAB77789 represent sequences used in the exemplification of the CC present invention.
                                                                                                                                                                                               Query Match

                                                                                                      Q
                                                                                                                                                                                                                                                                         Conditions, e.g., by protein or gene therapy. Such conditions include conditions, he manusomodulatory activity; activities; haemostatic, thrombotic or thrombolytic activities; receptor or ligand activities; or may be conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell conditions, horeast (e.g., myeloid or lymphoid cell cancers, healthy to protein or gene therapy. Such conditions include cancers, healthy terminates (e.g., sethman or arthritis), coronary heart disease.

Conditions, e.g., by protein or gene therapy. Such conditions and abnormal conditions, and abnormal conditions and ulcers), while those with the above the factor activity may be used to promote wound the activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to conditions, and incleotides and conditions and ulcers of the above conditions, and in drug screening techniques. The present sequence represents a cDNA encoding a covel human polypeptide of the invention.
                                                                                                                                                                                                 Query Match
                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell differentiation activities; stem cell growth factor activity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA0825-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 1; Page 1007-1008; 1963pp; English.

                                                                                                                                                                                                                                                                                                                            The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypnucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activinyinhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tang

The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity semotactic/chemokinetic activity, hemostatic and thrombolytic activity, chemotactic/chemokinetic activity, hemostatic assays for receptor activity, arthritis and inflammation, leukaemias and

The present invention describes primer sets for synthesising 5602 (C full-length cDNAs defined in the specification. Where a primer set (C comprises: (a) an oligo-dT primer and an oligonucleotide complementary (CC to the complementary strand of a polynucleotide which comprises one of (CC the 5602 nucleotide sequences defined in the specification, where the (CC oligonucleotide comprises at least 15 nucleotides; or (b) a combination (CC of an oligonucleotide comprising a sequence complementary to the (CC complementary strand of a polynucleotide which comprises a 5'-end (CC complementary strand of a polynucleotide which comprises a 5'-end (CC complementary to a complementary for comprises a 3'-end sequence (where the comprises a 3'-end sequence, where the (CC cligonucleotide comprises a 1'-end sequence, where the (CC clig
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ota T, 1

C-NT2RP2000329 has functions of converting extracellular signals into intracellular signals and changing cell morphology. The AK3-like protein, polynucleotides and antibodies are useful in the investigation of diseases such as MELAS (cerebral accident condition with hyperlacticacidemia), central nervous system disorder, epilepsy, skeletal muscle conditions, muscle disease, electron transfer disorders, Leber disease, diabetes mellitus, Peason disease, Parkinson's disease, metabolism disorders. They are useful for developing diagnostics and treatment agents. The present sequence represents a cDNA encoding a human AK3-like protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  27-AUG-1999;

The prese sequence encodes human GTP3P.

                                                                                                                                                                                                                                  CC AAC97991 to AAC98763 encode the human colon cancer associated proteins, CC called human colon cancer antigens, given in AAB53234 to AAB54006. The CC human colon cancer antigens can have cytostatic, cardioactive, muscular; CC entroprotective, immunomodulatory, gynaecological, gastrointestinal, CC vulnerary, nephrotropic, antiinfective and antibacterial activities, and CC can be used in gene therapy. The colon cancer antigen polynucleotides, CC proteins and antibacies to the proteins are useful for the prevention, CC treatment and diagnosis of colon disorders, such as colon cancer. The CC polynucleotides may be used in diagnostics and research, such as for CC chromosome identification, and as hybridisation probes. The proteins CC may also be used to prevent diseases such as neural disorders, immune CC system disorders, muscular disorders, reproductive disorders, such as proteins CC gastrointestinal disorders, wounds, renal disorders, infectious CC diseases, and cardiovascular disorders. AAC98764 to AAC98772 and AAB54007 represent sequences used in the exemplification of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             comprises: (a) an oligo-dr primer and an oligonucleotide comprises one of the 5602 nucleotide sequences defined in the specification, where the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises as sequence complementary to the complementary strand of a polynucleotide which comprises a 5 end complementary to a complementary for comprises at least 15 nucleotides and the combination of the 5 end sequence/3' end sequence is selected from those defined in the specification. The primers set useful for synthesising polynucleotides, and comparison to be useful for the particularly full-length cDNAs. The primers are useful for synthesising polynucleotides, comparison to the specification and complementary of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH33166 to AAH33628 and CDNAH3333 to AAH318742 represent human cDNA sequences; AAB92446 to compresent oligonucleotides, all of which are used in the exemplification confidence of the present invention.

                       of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination the 5'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and the specification.
                                                                                                                                                                                                The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination
                                                                                                                                                                                                                                                                                                                                                                                                                              Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ishii
                                                                                                                                                                                                                                                                                                                                                                                    Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         09-JUN-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB95893 represent oligonucleotides, all of which are used in the exemplification of the present invention.

CC full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dy primer and an oligonucleotide complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the CC oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises as sequence complementary strand of a polynucleotide which comprises a 5'-end CC polynucleotide which comprises a 3'-end sequence complementary to a complementary complementary to a complementary

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
